ALTRON HEALTHTECH

JOB PROFILE & ADVERT DETAILS

Senior QA Engineer — Automation & Quality Engineering

POSITION DETAILS

Position title: Senior QA Engineer (Automation & Quality Engineering)

Reports to: Carla Mars

Go-to-Market: Enterprise Applications

Practice: Software Engineering

ROLE CONTEXT

Altron HealthTech develops and supports healthcare technology across a varied product landscape. Solutions include web-based, desktop and cloud services, with integrations between products and external systems. The role will work with product, analysis, engineering, QA, cloud/platform and operations colleagues to improve quality across this landscape.

INITIAL MANDATE

The initial priority is to assess AHT requirements and the current testing landscape, identify material coverage and capability gaps, and recommend a prioritised improvement plan. This is a hands-on role: the Senior QA must personally design, build, execute and maintain automated tests, improve regression coverage and integrate automated checks into delivery pipelines, while leading the strategy and enabling others to execute it.

ROLE PURPOSE

Assess and strengthen quality engineering across AHT solutions through direct technical execution and leadership. The Senior QA will personally create, run and maintain automated tests; build and improve test coverage and regression suites; and implement automated checks in delivery pipelines. They will assess needs and gaps, lead a risk-based testing and automation strategy, and coach teams so others can execute and sustain it.

KEY RESPONSIBILITIES

Landscape assessment and improvement planning

- Review product and solution requirements for testability, acceptance criteria, quality risks and coverage needs.
- Assess the current test landscape across web, desktop, cloud and integrated solutions, including test levels, manual and automated coverage, frameworks, environments, pipelines, test data and release practices.
- Identify and prioritise gaps in automation, regression coverage, API/integration testing, performance/load testing, test data, environments and quality ownership.
- Produce a practical assessment of current state, key risks, recommendations and a sequenced testing and automation improvement plan.

Automation engineering and shift-left quality

- Personally design, code, execute, debug and maintain reliable automated tests using frameworks and languages suited to AHT's products and approved technology direction; demonstrate recent, substantial hands-on delivery rather than strategy-only oversight.
- Build and maintain automated coverage for high-value, repeatable and business-critical scenarios, including regression; select suitable automation candidates and balance automation with exploratory and manual testing.

- Implement and maintain automated checks in Azure-based delivery pipelines and CI/CD workflows where appropriate; troubleshoot failures and provide useful, actionable feedback to delivery teams.
- Embed testability, quality risks and test planning into requirements, design and development discussions; promote early defect prevention and efficient feedback loops.
- Lead the automation approach and guide teams on architecture, maintainability, coverage, coding standards and test-layer selection; coach and enable others to implement and maintain the agreed approach.

Test design and technical coverage

- Apply suitable functional and non-functional testing techniques, including risk-based, exploratory, boundary/value, regression, integration, end-to-end and acceptance testing.
- Plan and perform API testing, including contract/schema validation, authentication, data handling, error responses, retries and integration behaviour.
- Design and execute performance and load tests; define representative workloads, analyse results and communicate bottlenecks and capacity risks.
- Assess and test web-based, desktop and cloud-hosted solutions, including cross-system workflows and relevant deployment configurations.
- Support defect triage and root-cause analysis with developers, analysts and operations; verify fixes and assess regression impact.

Azure, test environments and test data

- Work with Azure cloud services and Azure DevOps or the equivalent AHT delivery tooling to support test environments, pipeline execution, evidence and release readiness.
- Plan and manage test data and environment needs so tests are repeatable, representative and controlled.
- Protect healthcare and personal information in test data; use synthetic, masked or otherwise approved data and follow applicable privacy/security controls, including POPIA requirements.
- Identify environment, configuration and dependency issues that affect reliable testing and coordinate their resolution.

Senior guidance, reporting and release support

- Provide senior technical guidance, coaching and practical support to QA, development and delivery colleagues; raise team capability in automation and quality practices.
- Develop test strategies and plans proportionate to business risk, solution complexity and release needs.
- Communicate test coverage, material risks, defects, readiness and residual quality concerns clearly to technical and business stakeholders.
- Support release decisions with evidence; do not present test execution as a substitute for accountable business, security or operational approval.
- Contribute to reusable testing standards, documentation, knowledge transfer and continuous improvement across AHT.

QUALIFICATIONS, EXPERIENCE & SKILLS

Educational qualifications

- Degree or diploma in Computer Science, Information Systems, Software Engineering or a related discipline, or equivalent relevant practical experience.
- ISTQB Foundation certification or equivalent testing knowledge preferred; relevant automation or cloud certifications are advantageous.

Experience

- Substantial, demonstrable hands-on experience in software QA / test engineering. Candidates must have personally designed, built, executed and maintained automated tests; managed test coverage and regression; and integrated automated checks into pipelines. The role also requires senior-level capability to assess a landscape, set direction and enable others to execute it. Confirm the formal years-of-experience threshold with HR.
- Demonstrated experience testing web applications and APIs, and practical experience with desktop and cloud solutions.
- Experience integrating automated tests into CI/CD or Azure-based delivery workflows.
- Experience with performance/load testing and test data preparation/management.
- Experience assessing test coverage, identifying quality risks and recommending improvements.

Essential technical and functional skills

- Hands-on automation engineering: personally selecting, building, executing, debugging and maintaining fit-for-purpose automated tests and frameworks; able to lead the approach and enable others to contribute.
- Test design techniques and risk-based test strategy across functional, integration, regression, end-to-end and acceptance testing.
- API and integration testing, including positive, negative, security-relevant and failure-path scenarios.
- Performance and load testing, result interpretation and clear reporting of findings.
- Testing web, desktop and cloud-hosted solutions; understanding of Azure services and Azure DevOps / CI/CD concepts.
- Test data and environment management, including privacy-aware handling of healthcare and personal data.
- Ability to review requirements for testability and collaborate effectively with analysts, product owners, engineers, QA and operations.

Desirable experience

- Healthcare software, clinical, practice-management, billing, claims or patient-information workflows.
- Experience working with multiple products, technology stacks or legacy and modern systems.
- AI solution evaluation or testing, including quality measures for AI outputs; this is desirable and does not replace core automation capability.
- Experience with security, accessibility, resilience or observability testing.

BEHAVIOURAL COMPETENCIES

- Strategic and systems thinking: connects immediate test needs to product risk and longer-term quality improvement.
- Shift-left mindset: engages early and prevents defects rather than relying only on end-stage testing.
- Practical leadership: provides clear guidance, coaching and constructive challenge without creating unnecessary process overhead.
- Analytical, structured and detail-oriented; communicates risks and evidence clearly.
- Collaborative and adaptable across business and technical teams; takes ownership and follows issues through.

INITIAL EXPECTED OUTPUTS

- A documented view of AHT's requirements and product/test landscape, including test coverage, automation, regression suites, environments, pipelines and test data, informed by direct review and execution.

- A prioritised gap and risk assessment, distinguishing urgent quality exposures from longer-term capability improvements.
- A practical testing and automation roadmap, including candidate pilot areas, dependencies and measures of progress.
- Hands-on delivery of, or direct contribution to, the highest-priority automation improvements, alongside technical guidance and coaching that enables the teams to execute and sustain them.

INTERVIEW PROCESS

Retain the organisation's approval workflow. The interview and technical assessment should evaluate landscape assessment, automation design, shift-left thinking, test techniques, API testing, performance/load testing, Azure/cloud, test-data management and senior guidance. Confirm panel, assessment format and any existing interviewer names with the Hiring Manager and HR.
